

FTDX101D/MP FTDX10 MOUSE & KEYBOARD INFO

The FTDX101MP and FTDX101D or FTDX10 support 2 USB-A port
Almost all peripherals (MOUSE and KEYBOARD) with cable are supported.

Although I find it useless to connect a keyboard and use it only to put the configuration.

The keyboard connected to FTDX101/FTDX10 is practically useless, only useful for writing messages that are done simply with the keyboard on the screen or with a mouse. The keyboard is VERY USELESS!

<u>Class code:</u> 0x03 (HID: Human Interface Device Class)	<u>Subclass code:</u> 0x01 (Boot Interface Subclass)	<u>Protocol code:</u> 0x01 (Keyboard) 0x02 (Mouse)
--	---	--

On the online forums we found these compatibilities:

WIRELESS MOUSE	
WORK	NOT WORK
M325C, M330, M310, M310t, old type M235, M135,	M187, new M235, M317c, M570, M215, M705, M1000, M185
WIRELESS KEYBOARD	
WORK	NOT WORK
WIRELESS KEYBOARD+MOUSE	
WORK	NOT WORK
	LOGITEC K260+M210

FTDX101/FTDX10 WIFI MOUSE COMPATIBILITY

Information retrieved on the net and from Yaesu infos

FTDX-101D/MP/FTDX-10

The FTDX101/FTDX10 will support the 2 USB-A port for the wireless device's specification listed below:

Class code:

0x03 (HID: Human Interface Device Class)

Subclass code:

0x01 (Boot Interface Subclass)

Protocol code:

0x01 (Keyboard)

0x02 (Mouse)

For example:

Logitech Marathon M310t (It will work)

<https://www.logitech.com/en-nz/product/wireless-mouse-m310>

Logitech Marathon M705 (It will not work)

<https://www.logitech.com/en-us/product/m705>

NOTE:

Here on the PDF site path there is a list that I update with the info I receive for the compatibility of the WIFI MICE. It would take very little to be able to make other models compatible by adding some additional drivers, at least the main ones ...

The corded ones I have tried, all work fine.

WIFI only a few, those that follow the original specifications.

Furthermore, applying a keyboard to the USB socket of the FTDX101/FTDX10 is also very useless, since it would only be used to write the messages of the KEYER CW, PSK and RTTY, your own name and nothing else.

It doesn't work on RTTY or CW or PSK, that would be interesting, but nothing interesting is enabled.

It is practically completely USELESS, already having an on-screen keyboard that is used only once.
